

MAD – Lab 5

AA 2018-2019

Expressing rating

- Users should be able to express evaluation about the food, restaurants and services in general
- This consists of a number (collected using the five-star methodology) and, optionally, a textual comment

Analytic page

- Customer's app show the most popular restaurants and foods and his "favourite list"
- Restaurateur's app show the most popular meals and timing of order
- Deliveryman's app show the kilometres travelled/achieved to monitor his financial situation

Plus

- In order to do so, the system should be able to track the events, keep the current status, and trigger rating requests whenever necessary
 - Extend the existing applications to provide these features, suitably updating the data structures and the user interface
 - Extend the profile view to see the average rating of the person and, possibly, comment details

Final rush!

- Finally, match the parts implemented and define the aesthetics.
